MapSan and the search for sanitation's elusive health impacts in the era of modern WASH trials

Friday, Mar. 20, 2020 at 12:50PM
Mann Hall, Room 323

A wave of epidemiological evidence in WASH has stimulated both panic among advocates and a re-thinking of WASH's value proposition as an essential component of public health infrastructure. In this talk, Brown will report results from the Maputo Sanitation (MapSan) trial, the largest controlled health impact trial to date of decentralized urban sanitation improvements, conducted from 2013 - 2019. Results from this and other recent trials open the way for new research, and provide important new context for scientists and engineers pursuing these critical interventions.
